Quiz 1: Understanding Skills and the Specification

Quiz 1: Understanding Skills and the Specification

[Copy page](#)

Test your understanding of skills and the Agent Skills Specification. Answer the following questions to check your knowledge before moving forward.

Question 1: What is a skill?

- ☐ A skill is a long prompt you paste into every conversation
- ☒ A skill is a reusable package of knowledge (instructions, scripts, and references) that makes agents expert at a specific task

Correct! Correct! Skills are portable, structured packages that include instructions, helper scripts, documentation, and metadata—all designed to make agents reliable at completing specific tasks.

- ☐ A skill is a feature only available in Claude Code
- ☐ A skill is a Python package you install with pip

[Submit](#)**You got all the answers!**

Question 2: What does the Agent Skills Specification define?

- ☐ The best practices for writing Python code in helper scripts
- ☐ Requirements for one hosting or distribution platform only
- ☐ Guidelines for writing instruction text in skills
- ☒ A standard format for packaging agent knowledge, including directory structure, metadata fields, and how agents discover and load skills

[Ask HuggingChat](#)

Correct! Correct! The Agent Skills Specification (at agentskills.to) defines the portable

format that allows skills to work across different agents and platforms.

Submit

You got all the answers!

Question 3: What are the required frontmatter fields in a SKILL.md file?

- ☐ name, description, version, and author
- ☐ Any metadata the creator wants to include
- ☒ name and description

Correct! Correct! The Agent Skills Specification requires two fields: 'name' (the identifier for the skill) and 'description' (what the skill does and when to use it). Other fields like license, compatibility, and metadata are optional.

- ☐ There is no required frontmatter—skills can be just Markdown files

Submit

You got all the answers!

Question 4: How do agents discover and load skills?

- ☐ Agents automatically load all available skills into context at startup
- ☒ Agents read skill metadata to decide if the skill applies, then load the full SKILL.md only when needed—this is called 'progressive disclosure'

Correct! Correct! The discovery process is progressive: agents first check metadata (~100 tokens), then load full skill content only when the task matches. This keeps agent startup fast.

- ☐ Users must manually activate skills by typing a command like '/skill dataset-publishing'
- ☐ Skills are only available if installed via npm or pip

Submit

You got all the answers!

Question 5: How many agents support the Agent Skills Specification?

Ask HuggingChat

- ☐ Only Claude Code and Codex
- ☐ Only agents developed by Anthropic
- ☐ Only agents from a single vendor or registry
- ☒ Many agents, including Claude Code, Codex, OpenCode, and others

Correct! Correct! The Agent Skills Specification is an open standard adopted by many agents. This means a single skill works across multiple platforms.

Submit

Scoring

Count your correct answers:

- **5/5:** Excellent! You have a solid understanding of skills and the specification. Move on to the next lesson.
- **4/5:** Good understanding. Review the questions you missed and reread those sections.
- **3/5 or less:** Consider reviewing the “What Are Skills” and “Skill Format” lessons before continuing.

Ready to learn how to use skills with different agents? Let’s move on to the next lesson.
